

Soil acidity: pH test.

Some plants like to grow in acidic soil while others prefer basic soil. Use this test to assess your soil's pH to determine what will grow best in your garden.

Mix two teaspoons of soil with one cup of distilled water. If you can seal your container, it might help to shake them up! Next, **dip your litmus paper into the water.** Use the colour scale that corresponds to your litmus paper to **read off your results.**

Find other tests and check out our work on our website:
