Social investment: Target efficiency and incentives

Susan St John

The Retirement Policy and Research Centre (RPRC), Child Poverty Action Group (CPAG) and Centre for Applied Research in Economics (CARE)

Time to learn from our history

 Economists love technocratic solutions to complex problems

 The future calls for subtle and sophisticated thinking- not robotic algorithms

First as tragedy:

The essential Rogernomics

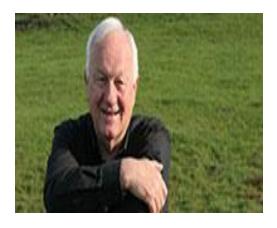

- Replace progressive taxation with a low flat tax
- User pays social provision to make the tax rate really low
 - Roger wanted a flat 23% tax
- Compensate the poor with targeted assistance
 - This is the understated Archillies heel

Bill English

 I joined Treasury and within 18 months or so I was working on Roger Douglas's flat tax package and had the unique opportunity at an early age to see radical ideas on tax debated, policies put together and then watch it all unravel.

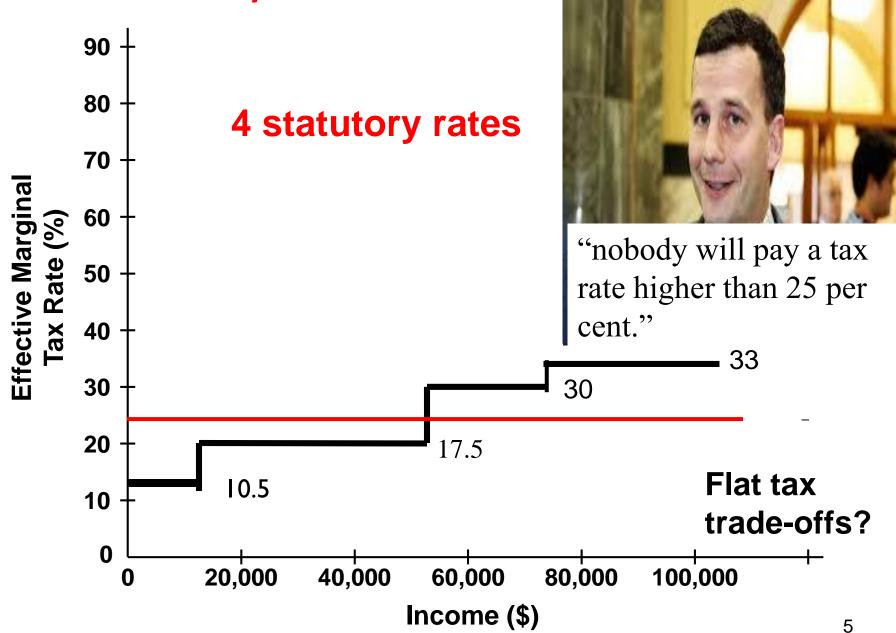

•

The one thing I learned from the flat tax package is that it doesn't work

NZ income tax system:

The first terrible lie of Rogernomics

• No one will pay more than the flat rate

The truth

Low income people face the loss of all kinds of social assistance when they earn an extra dollar

Complex overlapping abatements equals high effective marginal tax rates (EMTRs).

Terrible lie 2

Welfare only for the poor is efficient

More targeting is better

Lets aim for "target efficiency"!!

The truth–very high EMTRs over long income ranges have huge economic costs

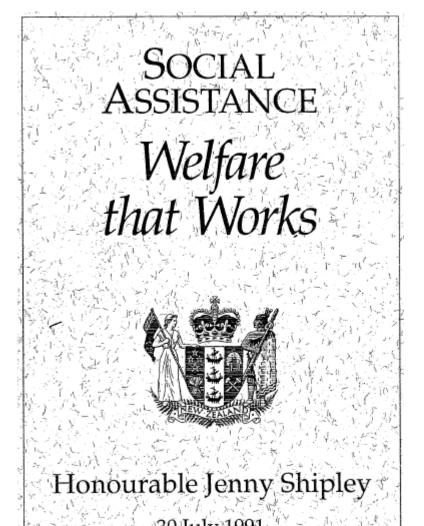

1991 Treasury warned

A system to provide targeted support raises the inevitable difficulty that an increase in income leads to a drop in assistance. That acts as a disincentive to extra earnings. When there are several schemes all phasing out independently such as occurs now with benefits, state house rents, childcare subsidies, tertiary allowances and Family Support, there is a risk that the effect of these different schemes will accumulate, leading to a drop in real income if earnings increase. This is a poverty trap. There has been some difficulty with such unco-ordinated schemes in the past. If there are now to be extra schemes, including assistance with possible health premiums, the problems of poverty traps could be greatly increased.

Terrible lie 3

9

All problems have a technocratic solution

Welfare that Works 1991

An integrated approach

It would be difficult to institute a system that is sensitive to family needs by merely looking at each service individually. For example, the ability to pay for health care depends on what the family must pay for other social services. It is impossible to gauge the impact each service has on a family's total circumstances without taking an integrated approach.

This section describes a new approach to determining entitlement for support. Its central feature is that it offers an integrated approach in which support for one social service is no longer worked out without reference to other services. Once that point is fully appreciated, the method involved in working it out is simply a matter of administration and detail.

The promise of technocracy

Welfare that Works 1991

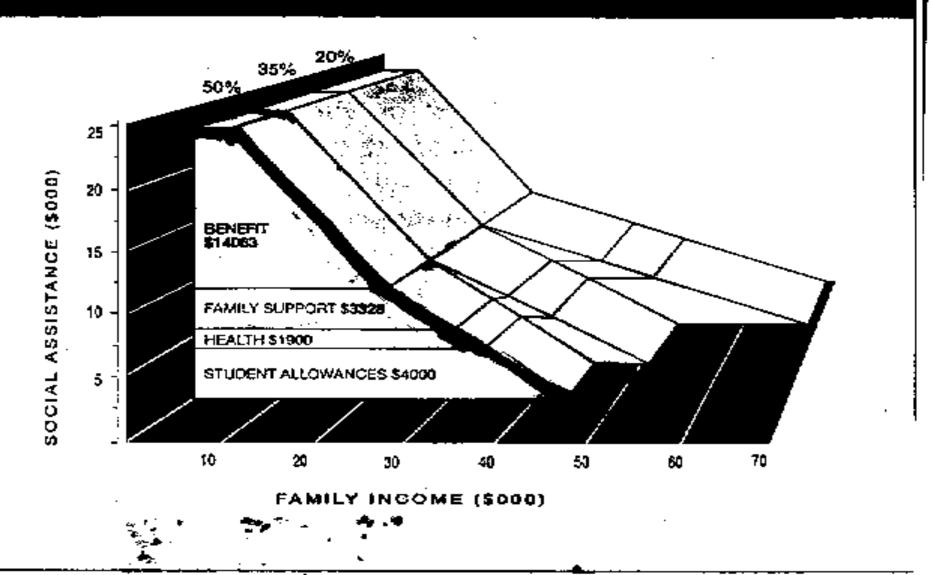

- the phasing out of one form of assistance to a social service to begin only after the previous assistance has been fully phased out;
- a single phase-out (or abatement) rate to apply across all forms of assistance to social services included in the scheme; and
- a single test of means to apply for all forms of assistance.

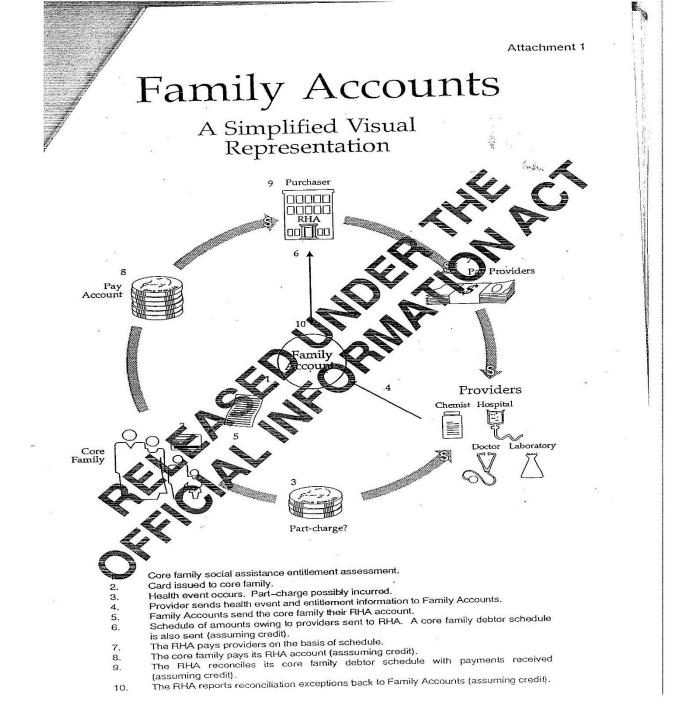

The integrated system of targeted assistance

- All a family's details would be on a smart card
- Adjustments in real time
- All social assistance would be aggregated and bleed out at one rate
- Diagrams would prove it could be done

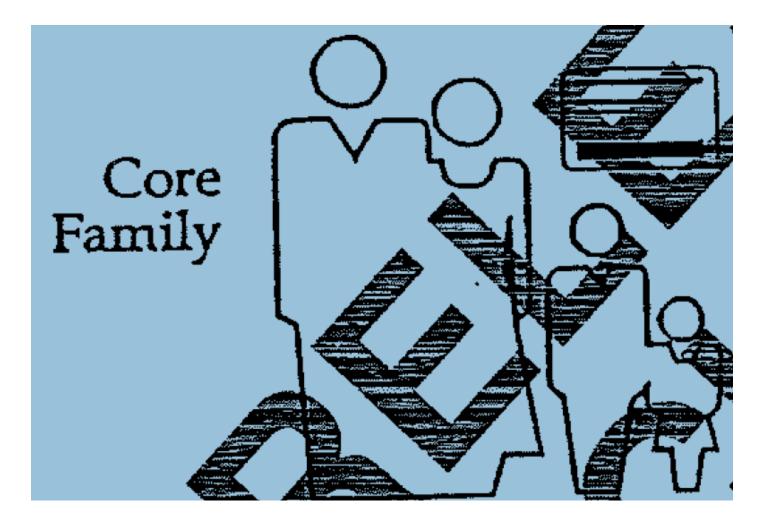

The EMTR problem

COUPLE WITH CHILDREN

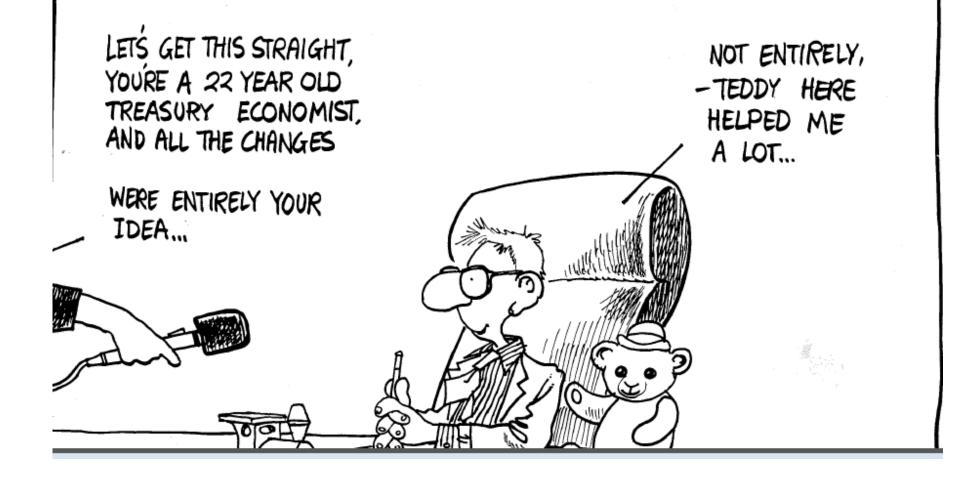

Core family stable & predictable

Where did the 1991 reforms come from?

Smart card was fanciful and they could not make it work

- The smart card was to 'overcome' the problems of overlapping abatements
- Its abandonment undermined the whole rationale for the user pays approach
- Left with the welfare mess/overlapping income tests including the bits for students and their parents.
- **Cumulative effects** on the distribution of wealth, income and advantage.

We were left with the welfare mess

Every family experiences the noose differently

 <u>http://thedailyblog.co.nz/2017/03/19/what-</u> would-you-do-prime-minister-english/

No accountability for failed promise on which the whole edifice of welfare reform was built. Modelling approach

To illustrate ...

 $-Y_{AG} =$
