

## Beca, an engineering and professional services consultancy working to achieve the SDGs

Beca’s immediate sustainability focus areas are on climate change and carbon emissions, and liveable cities/urbanisation; directly targeting Sustainable Development Goals 13 – Climate Action, and 11 – Sustainable Cities and Communities.

Tackling Goal 13, Beca was a founding signatory on the Business NZ Climate Leaders Coalition statement, committing to take voluntary action on climate change to reduce emissions in New Zealand. Operating across numerous sectors including energy, water, transport, infrastructure, defence, manufacturing and buildings, Beca together with their clients, aim to make everyday better by helping to reduce carbon emissions. In a tangible step to make such an impact, as part of new jobs and opportunities, Beca is incorporating climate change impacts and greenhouse gas emissions into the risk identification process. This will trigger conversations, challenge thinking and enhance innovation within the regions they work throughout New Zealand, Australia, Asia, the Pacific and Central America.

Beca has a direct role in creating Sustainable Cities and Communities (Goal 11) through a Beca initiative named Project Auckland. The initiative is in response to challenges and opportunities presented by Auckland’s population growth and resulting plans for significant investment from local and central government. Project Auckland puts together the best independent, cutting-edge thinking locally and from across the globe in a strategic approach for more integrated and sustainable solutions for transportation, water supply, social services, housing, commercial, industrial and urban development.
