### Motivation

### Example (Sequential Majority Voting in Preference Aggregation)

- \* ロ \* \* @ \* \* 注 \* 注 \* うくぐ

(日) (同) (日) (日)

## Motivation

#### Example (Sequential Majority Voting in Preference Aggregation)

Consider four alternatives a, b, c, d and suppose that  $\frac{1}{3}$  of the population endorses the preference orderings  $a \succ_1 b \succ_1 c \succ_1 d$ ,  $b \succ_2 c \succ_2 d \succ_2 a$  and  $c \succ_3 d \succ_3 a \succ_3 b$ , respectively.

Sequential majority voting is path-independent given  $\mu$ , that is:  $SMV_{\gamma}(\mu) = SMV_{\delta}(\mu)$  for all paths  $\gamma, \delta$ , if and only if the issue-wise majority view given  $\mu$  is feasible.

Example (Preference Aggregation): Strict orderings over alternatives a, b, c. Issue 1: "a > b?", issue 2: "b > c?", issue 3: "c > a?" Thus, X<sup>pref</sup> = {0,1}<sup>3</sup> \ {(0,0,0), (1,1,1)}.
The issue-wise majority view may be infeasible: E.g. <sup>1</sup>/<sub>3</sub> of the population endorse (1,1,0) ["a > b > c"], <sup>1</sup>/<sub>3</sub> endorse (0,1,1) ["b > c > a"], and another <sup>1</sup>/<sub>3</sub> endorse (1,0,1) ["c > a > b"], then issue-wise majority view (1,1,1) ∉ X<sup>pref</sup>.

The Judgement Aggregation Problem

# Path-(In)dependence

#### Proposition

Sequential majority voting is path-independent given  $\mu$ , that is:  $SMV_{\gamma}(\mu) = SMV_{\delta}(\mu)$  for all paths  $\gamma, \delta$ , if and only if the issue-wise majority view given  $\mu$  is feasible.

- Example (Preference Aggregation): Strict orderings over alternatives a, b, c. Issue 1: "a ≻ b?", issue 2: "b ≻ c?", issue 3: "c ≻ a?" Thus, X<sup>pref</sup> = {0,1}<sup>3</sup> \ {(0,0,0), (1,1,1)}.
- The issue-wise majority view may be infeasible: E.g. <sup>1</sup>/<sub>3</sub> of the population endorse (1, 1, 0) ["a ≻ b ≻ c"], <sup>1</sup>/<sub>3</sub> endorse (0, 1, 1) ["b ≻ c ≻ a"], and another <sup>1</sup>/<sub>3</sub> endorse (1, 0, 1) ["c ≻ a ≻ b"], then issue-wise majority view (1, 1, 1) ∉ X<sup>pref</sup>.
- SMV yields either (1, 1, 0), (0, 1, 1), or (1, 0, 1).

- Example (Committee Selection): K candidates for election into a committee with at least I members (I ≤ K) and at most J members (I ≤ J ≤ K). Issues: "elect candidate k?"
- Again, feasibility problem arises: E.g. <sup>1</sup>/<sub>3</sub> of the population endorse each of (1,0,1,0), (0,1,1,0) and (0,0,1,1), respectively. Then, if *I* = *J* = 2, issue-wise majority view (0,0,1,0) ∉ X<sup>com</sup>.
- If I = J = 2, SMV elects candidate 3 plus any one of the other candidates.
- Further examples: aggregation of weak orders, equivalence relations, partial orders, group identification á la Kasher and Rubinstein

Strong Sequential Unanimity Consistency

 Let X<sub>q</sub><sup>pref</sup> denote the space of all linear preference orderings over q alternatives.

Strong Sequential Unanimity Consistency

• Let  $X_q^{\text{pref}}$  denote the space of all linear preference orderings over *q* alternatives. Then, there exist critical fragments of all lengths up to *q*.

Strong Sequential Unanimity Consistency

 Let X<sup>pref</sup><sub>q</sub> denote the space of all linear preference orderings over q alternatives. Then, there exist critical fragments of all lengths up to q. Hence, X<sup>pref</sup><sub>q</sub> is strongly sequentially unanimity consistent if and only if q ≤ 3.

Strong Sequential Unanimity Consistency

## Examples

- Let X<sup>pref</sup><sub>q</sub> denote the space of all linear preference orderings over q alternatives. Then, there exist critical fragments of all lengths up to q. Hence, X<sup>pref</sup><sub>q</sub> is strongly sequentially unanimity consistent if and only if q ≤ 3.
- The spaces  $X_{L,M}^{\text{alloc}}$  are strongly sequentially unanimity consistent if and only if  $M \leq 3$ .

Strong Sequential Unanimity Consistency

## Examples

- Let X<sup>pref</sup><sub>q</sub> denote the space of all linear preference orderings over q alternatives. Then, there exist critical fragments of all lengths up to q. Hence, X<sup>pref</sup><sub>q</sub> is strongly sequentially unanimity consistent if and only if q ≤ 3.
- The spaces  $X_{L,M}^{\text{alloc}}$  are strongly sequentially unanimity consistent if and only if  $M \leq 3$ .
- One can show that the longest critical fragments in  $X_{I,J;K}^{com}$  have length

▲ロト ▲圖 ▶ ▲ 画 ▶ ▲ 画 ▶ ● のへで

Strong Sequential Unanimity Consistency

## Examples

- Let X<sup>pref</sup><sub>q</sub> denote the space of all linear preference orderings over q alternatives. Then, there exist critical fragments of all lengths up to q. Hence, X<sup>pref</sup><sub>q</sub> is strongly sequentially unanimity consistent if and only if q ≤ 3.
- The spaces  $X_{L,M}^{\text{alloc}}$  are strongly sequentially unanimity consistent if and only if  $M \leq 3$ .
- One can show that the longest critical fragments in  $X_{I,J;K}^{\rm com}$  have length

$$1+\max\{J,K-I\}.$$

▲ロト ▲圖 ▶ ▲ 画 ▶ ▲ 画 ▶ ● のへで

Strong Sequential Unanimity Consistency

## Examples

- Let X<sup>pref</sup><sub>q</sub> denote the space of all linear preference orderings over q alternatives. Then, there exist critical fragments of all lengths up to q. Hence, X<sup>pref</sup><sub>q</sub> is strongly sequentially unanimity consistent if and only if q ≤ 3.
- The spaces  $X_{L,M}^{\text{alloc}}$  are strongly sequentially unanimity consistent if and only if  $M \leq 3$ .
- One can show that the longest critical fragments in  $X_{I,J;K}^{\rm com}$  have length

$$1 + \max\{J, K - I\}.$$

Hence,  $X_{I,J;K}^{\text{com}}$  is not strongly sequentially unanimity consistent whenever  $K \ge 5$ .

Strong Sequential Unanimity Consistency

## Examples

- Let X<sup>pref</sup><sub>q</sub> denote the space of all linear preference orderings over q alternatives. Then, there exist critical fragments of all lengths up to q. Hence, X<sup>pref</sup><sub>q</sub> is strongly sequentially unanimity consistent if and only if q ≤ 3.
- The spaces  $X_{L,M}^{\text{alloc}}$  are strongly sequentially unanimity consistent if and only if  $M \leq 3$ .
- One can show that the longest critical fragments in  $X_{I,J;K}^{com}$  have length

$$1 + \max\{J, K - I\}.$$

Hence,  $X_{I,J;K}^{com}$  is not strongly sequentially unanimity consistent whenever  $K \ge 5$ . On the other hand, e.g.,  $X_{2,2,4}^{com}$  is strongly sequentially unanimity consistent.

Path-Dependence and Unanimity Violations ○○○ ○○○● Conclusion

Weak Sequential Unanimity Consistency

### Generalization to 'Simple Spaces' of Transitive Relations

#### Definition

A space X is a **simple space of transitive relations** if all critical fragments are entailed either by transitivity, symmetry, or asymmetry restrictions, respectively.

Examples of simple spaces of transitive relations are the spaces of all linear orders, all weak orders, all strict partial orders, all weak partial orders, and all equivalence relations.

#### Theorem

All simple spaces of transitive relations are weakly sequentially unanimity consistent.

### Sequential Majority Voting

- The Judgement Aggregation Problem
- Characterization of Path-Indepedence
- Sequential Majority Voting and the Condorcet Set

### 2 Path-Dependence and Unanimity Violations

- Strong Sequential Unanimity Consistency
- Weak Sequential Unanimity Consistency

### 3 Conclusion

Path-Dependence and Unanimity Violations

Conclusion

### **Concluding Remarks**

Path-Dependence and Unanimity Violations

Conclusion

### Concluding Remarks

• We have characterized all spaces which are strongly sequentially unanimity consistent, i.e. in which sequential majority voting never overrides unanimous consent, no matter in which sequence the voting takes place.

Image: A math a math

Path-Dependence and Unanimity Violations

Conclusion

## Concluding Remarks

- We have characterized all spaces which are strongly sequentially unanimity consistent, i.e. in which sequential majority voting never overrides unanimous consent, no matter in which sequence the voting takes place.
- The characterizing condition is a simple generalization of the condition that is necessary and sufficient for the consistency of issue-wise majority voting (given any profile of individual views).

Path-Dependence and Unanimity Violations

Conclusion

## Concluding Remarks

- We have characterized all spaces which are strongly sequentially unanimity consistent, i.e. in which sequential majority voting never overrides unanimous consent, no matter in which sequence the voting takes place.
- The characterizing condition is a simple generalization of the condition that is necessary and sufficient for the consistency of issue-wise majority voting (given any profile of individual views).

(日) (同) (三) (

• Very few aggregation problems verify this condition.

Path-Dependence and Unanimity Violations

Conclusion

### Concluding Remarks

• Remarkably, some important aggregation problems that are not strongly sequentially unanimity consistent satisfy the weaker requirement that there *exists* some decision path along which unanimous consent is always respected.

Image: A match a ma

Path-Dependence and Unanimity Violations

Conclusion

## Concluding Remarks

• Remarkably, some important aggregation problems that are not strongly sequentially unanimity consistent satisfy the weaker requirement that there *exists* some decision path along which unanimous consent is always respected.

Image: A match a ma

• These include the aggregation of linear preference orders, weak orders, strict partial orders, weak partial orders, and equivalence relations.

Path-Dependence and Unanimity Violations

Conclusion

## Concluding Remarks

- Remarkably, some important aggregation problems that are not strongly sequentially unanimity consistent satisfy the weaker requirement that there *exists* some decision path along which unanimous consent is always respected.
- These include the aggregation of linear preference orders, weak orders, strict partial orders, weak partial orders, and equivalence relations.
- An open problem is a general characterization of all weakly sequentially unanimity consistent aggregation problems.
